Theorem 2.15. An odd integer times an odd integer results in an odd integer.
Proof. Assume m and n are both odd integers.
Let $\mathrm{m}=2 \mathrm{k}+1$, and $\mathrm{n}=2 \mathrm{j}+1$
So $m n=4 \mathrm{kj}+2 \mathrm{k}+2 \mathrm{j}+1$
Which factors into $2(2 \mathrm{kj}+\mathrm{k}+\mathrm{j})+1$.

By definition $2.9(2 \mathrm{kj}+\mathrm{k}+\mathrm{j})$ is an integer.
so by definition 2.10 mn is an odd integer.

Theorem 2.12. The product of an odd integer and an even integer is odd.

Proof. The product of 2 times 3 is 6 , which is an even number.
